

It is clear that BPL is not yet ready for commercialization. It has been repeatedly demonstrated that it causes terrible interference in the HF and low-VHF spectrum, and as such, it will adversely affect millions of users of these frequencies. I personally hope someday to be able to take advantage of this technology, but it would be completely irresponsible to allow its use today when it will render much of the HF spectrum unusable. Does the FCC really want to have 700,000 irate hams (not to mention the many people who benefit from ham radio in times of disaster and emergency) knocking at their door and writing their congressmen demanding to know why the FCC has allowed this interference to go out over the public airwaves? Please do not approve the use of this technology until the BPL industry solves the interference problem.
